Architecture Selection

Corporate Mental Wellness and Counseling Platform
Thanishq Raam Paatil, PES1UG24CS502, Section I

We chose Microservices Architecture for the Corporate Mental Wellness and Counseling Platform.

Architectural Choice

We went with microservices for this platform. The system is split into an Identity Service, an Assessment Service and a Scheduler Service that sit behind an API Gateway. Each one does a single job and talks to the others only through clear interfaces. All of them store their data in one encrypted database.

Reason 1

Anonymity is the whole point of this platform, and microservices protect it well. Identity lives in its own service, so only that service knows who an employee really is. Therapists and every other service only ever see a pseudo ID. That keeps real names and emails away from the places that do not need them.

Reason 2

Booking gets busy at different times across global offices, while assessments stay fairly steady. With separate services each part can be scaled and updated on its own. If one service goes down the others keep working, so an employee can still book a session even when wellness tracking has an issue.

Security Advantage

Every request goes through the API Gateway, which checks who is calling and what they are allowed to do. Each service only exposes a small interface, so a problem in one does not spill into the rest. Employers never get access to individual records, and all data sits in an encrypted database.

Performance Benefit

The Scheduler Service can be scaled up during booking peaks without scaling the whole system. That keeps timezone conversions and slot lookups quick even under heavy load. Quieter services like assessments do not need extra resources, so the platform stays fast without wasting capacity.
